#### Abstract

In this study a real world industrial MPS problem is addressed using the SMF approach. A decision maker, analyst and implementer, all play significant roles in making judgements in an uncertain environment, which is where this difficulty arises in the chocolate manufacturing business. As analysts our goal is to identify a solution with a higher LOS that will enable the decision maker to reach a conclusion. Because all the coefficients including the goals, technical and resource factors are well defined. The MPS problem is taken into consideration. With 24 constraints and 6 variables, this is regarded as one of the sufficiently large problem, which LOV is appropriate for getting satisfactory OR can be determined by a decision maker. To increase the satisfactory income, the decision maker can also advice to the analyst some feasible modification to FI. This collaborative process between the analyst, decision maker and implementer must continue until the best possible solution is found and put into action.

Keywords: Linear Programming problem, S-curve membership function, Uncertainty, Mix-Product selection, Decision maker.

| Abbreviations |  |  |
| :--- | :--- | :--- |
| MPS | $:$ | mix-product selection |
| FLP | $:$ | fuzzy linear programming |
| MF | $:$ | membership function |
| SMF | $:$ | s-curve membership function |
| FO | $:$ | fuzzy outcome |
| FS | $:$ | fuzzy system |
| FI | $:$ | fuzzy interval |
| UOP | $:$ | units of product |
| LOS | $:$ | level of satisfaction |

LOV : level of vagueness

OR : optimal revenue
OF : objective function

## 1. Introduction

A non-linear MF, referred to as the SMF has been used in problems involving interactive FS. The modified SMF can be applied and tested for its suitability through an applied problem. In this problem, the SMF was applied to reach a decision, when all three coefficients such as OF, technical coefficients and resources of MPS were fuzzy. The solution thus obtained is suitable to be given to decision maker and implementer for final implementation. The problem illustrated in this paper is only one of six cases of MPS problems which occur in real life applications. It will be interesting to investigate the fuzzy solution patterns of these above MPS problem. Non-SMF conversion function is used for problems related to FLP. The function $S$ can be applied and tested for its effectiveness by applied pressure. In this example, the $S$ function is applied to make a decision after binary, such as the number of technologies and equipment, of which MPS is complex. Solutions thus obtained can provide the decision maker and the coordinator for the final implementation. The wording described in this article is just one of the three FPS words that actually have an application. The above FPS term is considered to be the real-life situation when it comes to making chocolate. Data for this problem are provided in the database of Choco man Inc, USA. Choco man manufactures chocolate bars, candies and wafer using a variety of ingredients and formulas. The goal is to use the modified S-function as a system to get the best UOP through the FLP system [1-3]. Compared with this FLP system. The recommended method is based on its relationship with the decision maker, developer and researcher to find satisfactory solutions for the FLP problem. In the decisionmaking process using the FLP model, modifications and source software can be complex, rather than providing exact numbers as in the net LP model. For example, machine hours, work, requirements, etc. and manufacturing, which is not always good, due to insufficient information and uncertainty among potential importers in the environment. Therefore, they should be considered as non-essential components and the FLP problem can be solved by using the FLP method. The problem of non-compliant MPS has been described. The aim of this article is to find the best UOP with high satisfaction and nonsense as the main thing. This problem is considered because all the parameters such as technology and hardware changes are uncertain. This is considered to be a major overall problem that includes 29 barriers and 8 barriers. Since there are so many decisions to make, the best UOP table is described for uncertainty and satisfaction to find a solution. with the highest UOP level and the highest satisfaction. It should be borne in mind that a high UOP does not mean it will lead to a high level of satisfaction. The best UOP was calculated at the satisfaction level using the FLP method. OF indicates that a high UOP will not lead to a high level of satisfaction. The results of this work suggest that the best decision is based on the negative impact on the FS of the MPS. In addition, high levels of UOP are obtained when blur is low in the system [4-25].

## 2. FLP Model

A general model of classical LP is formulated as,
$\operatorname{Max}(w)=d y ;$ The standard formulation subject to
$B \leq c ; y \geq 0$
Where $d$ and $y$ are the m-part vector, $B$ is $n \times m$ matrix. Since we live in an uncertain
environment, the number of objective functions $(d)$, the number of matrix technologies $(B)$ and the variability of assets $(d)$ are complex. Therefore, an infinite number can be displayed, so that the problem can be solved by the FLP system. FLP problems are designed as follows:
$\operatorname{Max}(w)=d^{*} y$; The fuzzy formulation subject to
$B^{*} y \leq c^{*} ; y \geq 0$
Where $w$ is the vector of the decision change, $B^{*}, c^{*} \& d^{*}$ are zero numbers. The function of addition and multiplication is explained by fact that in-depth numbers are derived from the extension principles of Li [26]. Njikọ Inequalities are provided by some relationship and work objectives, w , must take into account the given LP problem. The approach of Mohammed [27] is being considered to solve the problem of FLP 2 depletion., which means that the solution will probably be to some satisfaction. First, design the team function for the zero parameter of $B^{*}, c^{*} \& d^{*}$. Here, non-existent team functions, such as logic, are used. Here $v b_{k l}$ represents the work of members; $v c_{k} \& v d_{l}$ are the numerical functions for matrix $B$ for $k=1,2,3 \ldots n \& l=1,2,3, \ldots m . c_{k}$ is the numerical variable for $k=1,2,3 \ldots n$ and $d_{l}$ are the integers of purpose point $w$ for $l=1,2,3, \ldots m$.
Then, with the appropriate change in the concept of agreement between the non- $b^{*} k_{l}$ numbers; $c^{*} k$ and $d^{*} k_{l} \& l$, words for $b^{*} k_{l}, c^{*} k$ and $d^{*} l$ will be obtained. When an agreement between $b^{*} k_{l}$; The solution $c^{*} k$ and $d^{*} l$ will be [28];
$V=v_{d l}=v b_{k l}=v c_{k}$ for all
$k=1,2,3 \ldots n \& l=1,2,3, \ldots m$
Therefore, we can obtain,
$D=p d(v) ; B=p b(v) \& C=p c(v)$
Where $v \in[0,1]$ in $p d, p b \& p c$ are distinct functions [29], of $v d, v B \& v c$ resp. Equation (2.2) would be;
$\operatorname{Max}(w)=[p d(v)] y$; fuzzy formulation subject to
$[p b(v)] y \leq p c(v) ; y \geq 0$

First, create a group function for the complex part of $B^{*} \& c^{*}$. Here, non-uniform functions are used as S-curve function [30]. $v b_{k l}$ represents the work of members; where $b_{k l}$ is the coefficient of matrix $B$ for $k=1,2,3 \ldots, 29$ and $l=1,2,3, \ldots 8, c_{k}$ is the material variable for $k=1,2,3 \ldots, 29$. Group function is also obtained for $b_{k}$ and beard time, $c_{k b} \& c_{k c}$ for $c_{k}^{*}$. Similarly, we can create team work for a number of non-core technologies and their production [31]. Due to the high cost of production and the need to meet certain production and demand conditions, the problem of inefficiency arises in the manufacturing process. This problem also arises in the production of chocolate when deciding on the combination of ingredients to create different types of products. This is called here the choice of product mix [32].

## 3. The Fuzzy MPS

There are products that can be made by mixing different ingredients and using $k$ type processing. It is expected that the infrastructure will be massive. There are also some restrictions by the retail department, such as the requirement for the product mix, the requirement of the main product line, as well as the minimum and maximum query for each product. Not everything that is needed in these circumstances is obvious. It is important to achieve maximum UOP and satisfaction using the FLP method. Since the number of technologies and equipment changes is running high, the results of the UOP would be foolish. FLP problem, customized in size. 2 can be written:
$\operatorname{Max}(w)=\sum_{l=1}^{8} y_{l}$, subject to
$\sum_{l=1}^{8} b_{k l}^{*} y_{l} \leq c_{k}^{*}$, where $y_{l} \geq 0, l=1,2, \ldots 8$.
where $b_{k l}^{*} \& c_{k}^{*}$ are fuzzy parameters.

### 3.1 Fuzzy Resource Variable $v c_{k}$

For an interval $c_{k}^{b} \leq c_{k} \leq c_{k}^{c}$,
$b_{c_{k}}=\frac{c}{1+D e^{b\left(c_{k}-c_{k}^{b} / c_{k}^{c}-c_{k}^{b}\right)}}$
$\frac{\beta\left(c_{k}-c_{k}^{b}\right)}{e\left(c_{c}^{k}-c_{k}^{b}\right)}=\frac{1}{D}\left(\frac{c}{\theta_{c_{k}}}-1\right)$
$\frac{\beta\left(c_{k}-c_{k}^{b}\right)}{\left(c_{c}^{k}-c_{k}^{b}\right)}=\ln \left(\frac{1}{D}\left(\frac{c}{\theta_{c_{k}}}-1\right)\right)$
$c_{k}=c_{k}^{a}+\frac{1}{D}\left(\frac{\left(c_{c}^{k}-c_{k}^{b}\right)}{\beta}\right) \ln \left(\frac{1}{D}\left(\frac{c}{\theta_{c_{k}}}-1\right)\right)$
Since $c_{k}$ is a non-trivial material change therefore, from (3.2)
$c c_{k}^{*}=c_{k}^{b}+\left(\frac{\left(c_{c}^{k}-c_{k}^{b}\right)}{\beta}\right) \ln \left(\frac{1}{D}\left(\frac{c}{\theta_{c_{k}}}-1\right)\right)$

### 3.2 Fuzzy Constraints

The products, materials and equipment requirements are shown in Tables 1 as well as 2 , respectively. Tables 3 as well as 4 provide the mix size and use the required material to make each product.

Table 1: Product's Demand.

| Item | Fuzzy Interval (×1000units) |
| :---: | :---: |
| Milk Chocolate, (200 gram) | $[450-575)$ Gram |
| Milk Chocolate, (50 gram) | $[750-950)$ Gram |
| Crunchy Chocolate, (200 gram) | $[350-450)$ Gram |
| Crunchy Chocolate, (50 gram) | $[550-700)$ Gram |
| Chocolate with Nuts (200 gram) | $[250-325)$ Gram |
| Chocolate with Nuts (50 gram) | $[450-575)$ Gram |
| Chocolate Candy | $[150-200)$ Gram |
| Wafer | $[350-450)$ Gram |

Table 2: Material and Ease of Access

| Raw Material | Fuzzy Interval (x1000 units) |
| :---: | :---: |
| Coco (Kilo Gram) | $[75-125)$ Kilo Gram |
| Milk (Kilo Gram) | $[90-150)$ Kilo Gram |
| Nuts (Kilo Gram) | $[45-75)$ Kilo Gram |
| Sugar (Kilo Gram) | $[150-450)$ Kilo Gram |
| Flour (Kilo Gram) | $[15-25)$ Kilo Gram |
| Aluminum Foil (Kilo Gram) | $[375-625)$ Kilo Gram |
| Paper (Per Feet Square) | $[375-625)$ Per Feet Square |
| Plastic (Per Feet Square) | $[375-625)$ Per Feet Square |
| Cooking (Ton per H) | $[750-1250)$ Ton Per H |
| Mixing (Ton per H) | $[150-250)$ Ton Per H |
| Forming (Ton per H) | $[1125-1875)$ Ton Per H |
| Grinding (Ton per H) | $[150-250)$ Ton Per H |
| Wafer Making (Ton per H) | $[75-125)$ Ton Per H |
| Cutting (H) | $[300-350)$ H |
| Packaging 1 (H) | $[300-500$ ) H |
| Packaging 2 (H) | $[900-1500)$ H |
| Labor (H) | $[750-1250)$ H |

There are two unclear barriers such as access to the equipment and restrictions on the capacity of the equipment. These barriers are inevitable for any object and property depending on the consumption of the property, to trade and acquire property. These selections are based on the FLP resolution of Chocoman Inc. Decision changes for the FPSP are defined as:
$y_{1}=250$ grams of chocolate milk to be produced (in 1000)
$y_{2}=100$ grams of chocolate milk to be produced (per 1000)
$y_{3}=$ Chocolate Crispy of 250 grams to be produced (in 1000)
$y_{4}=100$ grams of Chocolate Crispy to be produced (in 1000)
$y_{5}=$ Chocolate with 250 grams of fruit to produce (en1000)
$y_{6}=$ Chocolate contains 100 grams per gram to produce (in 1000)
$y_{7}=$ Chocolate candies will be produced (in 1000 packages)
$y_{8}=$ Chocolate wafer production (in 1000 packages)

The Chocoman Marketing Department has issued the following restrictions:
Product mix required. Large product ( 250 grams) of any kind should not exceed $60 \%$ (uncertain value) of small product (100 grams)

Pandit U. Chopade, Mahesh M. Janolkar, Kirankumar L. Bondar
DECISION MAKING THROUGH FUZZY
RT\&A, No 4 (76)
LINEAR PROGRAMMING APPROACH
$y_{1} \leq 0.6 y_{2}$
$y_{3} \leq 0.6 y_{4}$
$y_{5} \leq 0.6 y_{6}$
The required product line is key. Total sales of confectionery products and wafers should not exceed $15 \%$ (uncertain value) of total confectionery product.

Table 3: Mixing Proportions

| Materials Required Per 1000 Units | Product types (fuzzy interval) |  |  |  |  |  |  |  |

## 4. Results

The FPS problem is solved by using MATLAB and its LP application. It provides complexity and a degree of satisfaction. The LP application has two extras in addition to the non-existent. There is an output $\mathrm{w}^{*}$, the best UOP.

Different standards of Chocolate production are transferred to the toolbox. The answer can be listed in the following tables. From Table 5, it can be seen that a high level of satisfaction provides a high UOP. But the best solution to the above problem is at a satisfaction rate of $50 \%$, or 2833 minutes. From the tables below, we conclude that within the objective, $w^{*}$ is an ever-increasing function [33].

Table 8: Optimal UOP $w^{*}$

### 4.1 UOP of $w^{*}$ for different vagueness values

Reasonable solutions and some uncertainties in the zero parameter of the technical rate and the hardware change are equal to $50 \%$. Thus, the result of the $50 \%$ satisfaction level for $1 \leq \beta \leq 37$ and the principle corresponding to $w^{*}$ are shown in Table 6. OF's of UOP reduce $\beta$ imprecision and increase of the non-linear parameter of the number of technologies and asset exchange. This is clearly shown in Table 6. Table 6 is very important for the decision maker when choosing UOP, so that the result is at perfect level.

### 4.2 Output for $\theta, \beta \& w^{*}$

The result in the table below shows that when the inaccuracy of the increase results in a small UOP.

Table 12: $w^{*}$ with resp. to $\beta \& \theta$

| Satisfaction <br> Degree $(\theta)$ | Vagueness <br> $(\beta)$ | Optimal <br> $\operatorname{UOP}\left(w^{*}\right)$ | Satisfaction <br> Degree $(\theta)$ | Vagueness <br> $(\beta)$ | Optimal <br> UOP $\left(w^{*}\right)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 7.562 | 1 | 2500.51 | 50.0115 | 21 | 3001.89 |
| 14.076 | 3 | 2615.83 | 52.1911 | 23 | 3057.48 |
| 15.2145 | 5 | 2651.25 | 52.8741 | 25 | 3152.55 |
| 16.1148 | 7 | 2701.67 | 59.6383 | 27 | 3180.37 |
| 18.057 | 9 | 2845.48 | 63.3374 | 29 | 3204.67 |
| 24.8497 | 11 | 2848.79 | 63.538 | 31 | 3250.39 |
| 28.9782 | 13 | 2889.39 | 64.8241 | 33 | 3277.92 |
| 30.3968 | 15 | 2923.44 | 70.4424 | 35 | 3338.54 |
| 31.7572 | 17 | 2955.9 | 83.3374 | 37 | 3344.58 |
| 42.6513 | 19 | 2965.11 |  |  |  |

It is also seen that SMF has a variety of standards that provide possible solutions with some satisfaction. Also, the link between $w^{*} \& \theta$ is provided in Tables $7,8,9,10$ and 11 . This is clearly shown in Table 6 . Table 6 is very important for the decision maker when choosing UOP, so that the result is a perfect level. From Tables 7, 8, 9, 10 and 11, we find that for each type of satisfaction $\theta$, the optimal UOP $w^{*}$ decreases as the endpoint increases between 1 and 37 . Similarly, with any positive value, the optimal UOP increases as the degree of satisfaction increases. Table 12 is the result of the diagonal pattern of $w^{*}$ in Table 6. This result shows that, when the inaccuracies are low at $\beta=1,3 \& 5, \mathrm{UOP} \mathrm{w}^{*}$ is best and reached the lowest satisfaction level, $\theta=7.5 \%, 14.1 \% \& 15.2 \%$. When the odds are high at $\beta=33,35 \& 37$, UOP $w^{*}$ is best reached with high satisfaction level, i.e., $\theta=64.8 \%, 70.4 \% \& 83.3 \%$.

## 5. Selection of Parameter $\beta$ and Decision Making

In order for the decision maker to get the best results for the UOP $w^{*}$, the researcher creates a production table. From the table above, the decision maker can select the negative value according to his preference. Hair volume is divided into $w^{*}$ in three parts, namely short, medium and high. It can be slightly modified if the input data for the number of technologies and hardware changes. It can be called a bunch of empty vanities. The decision can be made by the decision maker by choosing the best UOP for $w^{*}$ and providing solutions for its implementation.

### 5.1 Discussion

The results show that the UOP minimum is $2,755.4$ with a maximum of $3,034.9$. It can be seen that when the understanding is between 0 and 1, the maximum value of $w^{*} 3034.9$ is obtained by the minimum value. Similarly, when over 39, the minimum gain of $w^{*} 2,755.4$ and the maximum gain are obtained. Since the solution for MPS nonsense is the most satisfying solution with a high satisfaction degree, it is important to choose a blur between the minimum value and the maximum value of $w^{*}$.

## 6. Conclusion

The purpose of this research project was to find the most effective POU for MPS problems that have not been identified. SMF was recently developed as a framework for the task of solving the above problems effectively. The decision-making process and its implementation will be easier if the decision maker and consultant can work with the analyst to get the best and most satisfactory results. There are two more cases to consider in future work of the running technology that is not negative and that the dynamic assets are running and not complicated. FS mathematical relationships can be developed for MPS problems to find satisfying solutions. The decision maker, researcher and practitioner can apply their knowledge and experience to get the best results.
